Implementing an Ansible Playbook

Mohamed Amin AYED

Made the full playbook

```
[student@workstation playbook-review]$ nano internet.yml
[student@workstation playbook-review]$ cat  internet.yml
---
- name: Enable internet services
  hosts: serverb.lab.example.com
  become: true
  tasks:
    - name: install latest
      ansible.builtin.dnf:
        name:
          - firewalld
          - httpd
          - mariadb-server
          - php
          - php-mysqlnd
        state: latest
    - name: firewall configuration
      ansible.builtin.service:
        name: firewalld
        enabled: true
        state: started
    - name: firewalld permits http service
      ansible.posix.firewalld:
        service: http
        permanent: true
        state: enabled
        immediate: true
    - name: ensure httpd runnning
      ansible.builtin.service:
        service: httpd
        state: started
        enabled: true
    - name: ensure mariadb running
      ansible.builtin.service:
        service: mariadb
        state: started
        enabled: true
    - name: copy files
      ansible.builtin.copy:
        src:index.php
        dest: /var/www/html/index.php
        mode: 0644
- name: on the control node
  hosts: workstation
  become: false
  tasks:
    - name: Test access to http server from control node
      ansible.builtin.uri:
        url: http://serverb.lab.example.com
        status_code: 200
```

Let’s check for syntax errors:

```
[student@workstation playbook-review]$ ansible-navigator run -m stdout internet.yml --syntax-check
ERROR! We were unable to read either as JSON nor YAML, these are the errors we got from each:
JSON: Expecting value: line 1 column 1 (char 0)

Syntax Error while loading YAML.
  mapping values are not allowed in this context

The error appears to be in '/home/student/playbook-review/internet.yml': line 39, column 13, but may
be elsewhere in the file depending on the exact syntax problem.

The offending line appears to be:

        src:index.php
        dest: /var/www/html/index.php
            ^ here
Please review the log for errors.
[student@workstation playbook-review]$ nano internet.yml
[student@workstation playbook-review]$ ansible-navigator run -m stdout internet.yml --syntax-check
```

We found an error, let’s fix it and try again:

```
[student@workstation playbook-review]$ ansible-navigator run -m stdout internet.yml --syntax-check
playbook: /home/student/playbook-review/internet.yml
```

=>Success

Now let's run it

```
[student@workstation playbook-review]$ ansible-navigator run -m stdout internet.yml

PLAY [Enable internet services] ************************************************

TASK [Gathering Facts] *********************************************************
ok: [serverb.lab.example.com]

TASK [install latest] **********************************************************
changed: [serverb.lab.example.com]

TASK [firewall configuration] **************************************************
ok: [serverb.lab.example.com]

TASK [firewalld permits http service] ******************************************
changed: [serverb.lab.example.com]

TASK [ensure httpd runnning] ***************************************************
changed: [serverb.lab.example.com]

TASK [ensure mariadb running] **************************************************
changed: [serverb.lab.example.com]

TASK [copy files] **************************************************************
changed: [serverb.lab.example.com]

PLAY [on the control node] *****************************************************

TASK [Gathering Facts] *********************************************************
ok: [workstation.lab.example.com]

TASK [Test access to http server from control node] *****************************
ok: [workstation.lab.example.com]

PLAY RECAP *********************************************************************
serverb.lab.example.com    : ok=7    changed=5    unreachable=0    failed=0    skipped=0    rescued=0    ignored=0
workstation.lab.example.com : ok=2    changed=0    unreachable=0    failed=0    skipped=0    rescued=0    ignored=0
```

- ⇨ Everything was ran successfully

And Redhat agrres as well:

```
Grading lab.

 · Checking lab systems ..... SUCCESS
 · Ensuring httpd package is installed on serverb ..... PASS
 · Ensuring mariadb-server package is installed on serverb ..... PASS
 · Ensuring php package is installed on serverb ..... PASS
 · Ensuring php-mysqlnd package is installed on serverb ..... PASS
 · Ensuring httpd service is started on serverb ..... PASS
 · Ensuring mariadb service is started on serverb ..... PASS
 · Ensuring http service is enabled in firewalld on serverb ..... PASS
 · Ensuring the web server is reachable on serverb ..... PASS

Overall lab grade: PASS
```

END
